    int ceil = Ceil(node-> left, x);
    return (ceil >= x) ? ceil : node->data;
```

Floor and Ceil in C++

BST Structure

Let's first visualize the tree:

You're querying for:

- Floor of 7
- Ceiling of 7
- ▼ Floor Function Walkthrough (tree.Floor(tree.root, 7))

Node\* Floor(Node\* node, int x)

We need the largest value  $\leq 7$ .

Step	Current Node	Comparison (data vs 7)	Action	Floor Candidate
1	8	8 > 7	Go left	nullptr
2	4	4 < 7	Save 4, go right	4
3	6	6 < 7	Save 6, go right	6
4	null	-	Exit loop	6

**Result:** Floor of 7 is 6

▲ Ceil Function Walkthrough (tree.Ceil(tree.root, 7))

We need the smallest value  $\geq 7$ .

int Ceil(Node\* node, int x)

It's a recursive function.

Step	Node	Comparison (data vs 7)	Action	Result
1	8	8 > 7	Check left subtree	Left = 4
2	4	4 < 7	Recurse right $\rightarrow 6$	

```
};
                                                                           Comparison
                                                             _{
m Step} |_{
m Node}|
                                                                                                          Result
                                                                                              Action
                                                                            (data vs 7)
int main()
                                                                                            Recurse
                                                                                                         Return
  BSTFloorCeil tree;
                                                                   6
                                                                          |6 < 7|
                                                                                            right \rightarrow
                                                                                                          -1
                                                                                            null
  // Construct the BST
  tree.root = new BSTFloorCeil::Node(8);
                                                                                            return
